

# Camera Inspections

A camera inspection of the sewer line will show the exact condition of the piping, any damage to the line and the life expectancy to prevent surprises.

Oftentimes, when individuals cable their drain they notice that there is a certain degree of backup still present in the line. While they can see that they've cleared the clog, what they cannot see is any potential underlying causes. Camera inspections of the sewer line are helpful in giving the home owner complete access to the line and, in time, incredible savings.

Enzymatic drain cleaners contain bacteria cultures and concentrated enzymes that react with organic residue that builds up on sewer pipes, dissolving the residue to help prevent slow-running drains. Most enzymatic drain cleaners are intended for general maintenance to maintain proper flow. Some advantages to enzyme drain cleaners include, but are not limited to, their low cost, easy to use methods, safety for a wide range of plumbing fixtures and low environmental impact.

For a "right now" fix, consumers like "Thrift Odorless Drain Cleaner." The usual cause for sluggish drains is a build-up of grease, hair, soap scum or bath oils. Most drain cleaners require 2-6 hours for results. Thrift will liquify hair and grease in less than 60 seconds! Hot water activates Thrift's dry, odorless crystals. Within 60 seconds the drain is clear; even on the most difficult drain blockage. Thrift is also great for sewer lines, grease traps, and septic systems.
