SEWER

"One call can fix it all!"

Jetting Sludge

Jetting equipment cleans sewers lines better than snakes. Jetters use varying degrees of water pressure to cut through grease and other debris that build up in drain pipes and draw it back where it can be vacuumed out, providing a more thorough cleaning.

Clearing Tree Roots

If tree roots are not disturbed, the roots will completely fill the pipe with multiple hair-like masses at each point of entry. The root masses can quickly become clogged with toilet tissue, grease and other debris flowing through the main line. Some pipe materials are more susceptible to root intrusion than others. In some cases, drain snakes cannot be used to clear tree roots. Other methods to clear roots would be trimming with various size blades or high-pressure water jet systems. The best thing to do is camera the line to determine the damage and type of pipe.

Temp-Aire Sewer Maintenance

The main line is the one and only pipe that carries wastewater out of the home or building. All of the drains empty into the main line and are then transported to the wastewater treatment system. Preventive maintenance is having that main line cleaned on an annual or biannual basis to help prevent future backup. Not only does preventative maintenance prevent sewage from backing up, it increases the longevity of the main sewer pipe. Tree roots and sludge, among other things, can effect not only the flow of the wastewater but the life of the pipe as well. Call Temp-Aire to talk more about the positives of main line preventative
